

Digital Strategy

Why digital is important:

- Facilitate building- / construction work-LCA
- Demand for digital data from products for building level
- Harmonization of environmental product-data

What does this mean for ECO Platform?

- Define digital declaration format and quality of the data
- Define rules for the exchange of the data
- Create an exchange network (open database network) to achieve increased availability of EPD-data
- Organize / facilitate implementation by ECO Platform's members (esp. EPD POs)

Principles:

- do not re-invent the wheel (use available resources)
- Avoid babel-tower confusion (coordinate work with other initiatives – no conflicting parallel developments)
- Base solution on available standards (ISO, CEN)

Action

1. Screen market for existing formats, DB-networks or for initiatives with work in progress
=> InData already developed digital format and started to implement database-network
=> no other initiative found, which is that far
2. Preferred solution:
 - Implementation of InData solutions by ECO Platform's members
 - Ensure compliance of InData solutions with the principles developed by ECO Platform as well as with CEN and ISO standards
3. Cooperate with InData (build on available solution, competences and resources)
 - See attachment "Cooperation ECO Platform and InData Group"
 - Governance / set-up to be defined
